PAWS Volunteer Portal

Form Controls Activity & Implementation Report

Implementation documentation | October 2026

Project Title: A Web-Based Volunteer Management System with Integrated Time and Access Control for the Philippine Animal Welfare Society (PAWS).

This focused activity implements two major forms and two supporting forms. It connects form inputs, validation, saved results, remote review, and reporting using React and Node.js. The green, cream, white, and charcoal interface follows the PAWS design palette; this is an academic demonstration project and not an official PAWS service.

Control Implementation Matrix

Classification	Implemented Form	Controls
Major 1	Create Event	8 inputs + 2 buttons
Major 2	Volunteer Profile & Vaccination Update	8 inputs + 2 buttons
Supporting 1	Remote Work Submission	8 inputs + 2 buttons
Supporting 2	Report Filters & Generation	8 inputs + 2 buttons

System Operation & Execution

Run `npm install`, then `npm run dev`, and navigate to `http://localhost:3000`. Local demonstration mode uses fictional identities and saves records/files under `data/`. The identity selector is provided for evaluation convenience and does not constitute secure authentication.

Roles & Access: Staff member *Ana Cruz* creates events, reviews remote submissions, and generates system reports. Volunteers *Maya Santos* and *Luis Reyes* manage profile records and submit remote hours.

Supabase Integration Note: Environment configuration, verified bearer tokens, staff/volunteer roles, a private JSONB activity store, and cloud storage are built-in. Its schema is streamlined relative to the complete thesis ERD. Live Supabase endpoints operate when active project credentials are set.

Form Validation & Specification Controls

Each implemented form follows standard client and server validation requirements to maintain system state integrity and verify required fields prior to submission.

ID	Control Field	Type	Validation & Business Rules
01	Event Title / Profile Name	Text Input	Required, 3–100 characters. Sanitized input.
02	Activity / Vaccination Date	Date Picker	Must be a valid date format (YYYY-MM-DD).
03	Volunteer / Staff ID	Select / Hidden	Must map to a valid record in state.
04	Hours Claimed	Numeric Input	Min: 0.5, Max: 12.0 hours per submission.
05	Proof Document / Image	File Upload	Max size 5MB. Formats: PNG, JPG, PDF.
06	Category / Department	Dropdown	Selection required from predefined enumeration.
07	Submit Action	Button	Triggers local/remote validation before payload emit.
08	Reset / Cancel Action	Button	Clears non-persistent form state and resets errors.

Browser Evidence & Visual Verification

The form states were verified across multiple viewport configurations including standard desktop and 390px mobile layouts. Captured evidence files are stored in `docs/screenshots/`.

Workflow 1: Event Creation

Validation & Invalid Handling

```

Automated & Manual Verification Checks

> **Automated Test Suite:** Production build completed successfully. Six automated integration tests passed, covering form validation, local storage persistence, staff-only action guards, evidence file access control, duplicate time-claim blocking, concurrent approval handling, and CSV export formatting.
>
> **Headless Chrome Verification:** Verified end-to-end user journeys for four form workflows, field error prompts, reload state persistence, staff review screens, report preview/download, and responsive 390px mobile viewports without console errors.

Scope Limitations & Group Deliverables

Live cloud integration requires active Supabase credentials to be set in environment variables. Full thesis modules (such as kiosk biometric attendance and automatic task claiming) remain outside the scope of this activity.

> **Submission Checklist:** Group members must be cited in Canvas comments, supply the repository link containing commit history, and submit a 2–4 minute video walk-through created according to `docs/demo-script.md`.
